ACKNOWLEDGEMENTS

This study would not have been possible without substantive comments and contributions from colleagues and partners worldwide. The authors would like to thank the following persons in particular: International Monetary Fund staff led by Sanjeev Gupta (Deputy Director of Fiscal Affairs Department, IMF); Rob Vos (Director of Development Policy and Analysis Division, United Nations Department of Economic and Social Affairs, UNDESA); Shari Spiegel (Senior Economic Affairs Officer, UNDESA); Anisuzzaman Chowdhury (Senior Economic Affairs Officer, UNDESA); Oliver Paddison (Economic Affairs Officer, UNDESA); Moazam Mahmood (Director of Economic and Labour Market Analysis Department, International Labour Organization, ILO); Michael Cichon (Director of Social Security Department, ILO); Rolph van der Hoeven (Professor of Employment and Development Economics, Erasmus University; former Manager of the World Commission on the Social Dimensions of Globalization); Alice Amsden (Barton L. Weller Professor of Development Economics, Massachusetts Institute of Technology, USA); Anne Jellema (Director of Policy, Action Aid International); and Sebastian Levine (Senior Economist, United Nations Development Programme, UNDP Uganda). Special thanks to Richard Morgan, Director of Policy and Practice, UNICEF, for his guidance and comments.

The views, findings and conclusions in this paper remain the responsibility of the authors.

Executive Summary

This paper examines expenditure projections over the near term and their potential implications for children and poor households during the economic recovery. It begins by analyzing whether expenditure consolidation is already or likely occurring in 2010-11. Using fiscal projection data published by the IMF for 126 low and middle income countries, we find that nearly half of the sample (44 percent) is expected to reduce aggregate government spending in 2010-11 when compared to 2008-09. This is of concern both in terms of GDP—where the average reduction is 2.7 percent of GDP—as well as in the real value of total government expenditures—where about 25 percent of the sampled countries is expected to make reductions of an average of 6.9 percent of expenditures. The overall timing and scope of projected spending contraction raise concern in light of the still fragile and uneven recovery and the continued crisis impacts on vulnerable populations in many developing countries.

In this general climate, we discuss the risks of pro-poor social spending being curtailed during the recovery. We then identify common adjustment measures considered by policymakers during the period 2009-10, which include (i) wage bill cuts or caps, (ii) limiting subsidies and (iii) further targeting social protection, as well as highlight their potential risks to children and poor households.

While recognizing the importance of macroeconomic stability and improving overall fiscal positions to provide space to mitigate future shocks, the paper questions if the projected fiscal adjustment trajectory in a number of countries—in terms of timing, scope and pace—is conducive to the objective of adequately protecting vulnerable households and the achievement of development goals such as the MDGs. Financing options for pro-poor social spending are also explored. We further encourage policymakers and development partners to evaluate the potential human and development costs of foregone social expenditures and to consider alternative policy measures to ensure a “Recovery for All” that is both fiscally sustainable and effective in terms of human development with equity for the poor.

Résumé Analytique

Ce document examine les projections des dépenses à court terme et leurs implications potentielles pour les enfants et les ménages pauvres au cours de la reprise économique. Il commence par analyser si la consolidation des dépenses est déjà survenue, ou susceptible de survenir, en 2010-11. En utilisant des données de projection financière publiées par le FMI pour 126 pays à faible ou moyen revenu, nous constatons que près de la moitié des pays de l'échantillon (44 pour cent) ont prévu de réduire leurs dépenses publiques en 2010-11 par rapport à 2008-09. Cette situation est préoccupante tant en termes de PIB (où la réduction moyenne est de 2,7 pour cent du PIB), que pour la valeur réelle des dépenses totales des administrations publiques (pour lesquelles on estime qu'environ 25 pour cent des pays de l'échantillon vont réduire leurs dépenses de 6.9 pour cent en moyenne). Le calendrier et la portée de la contraction des dépenses prévues sont préoccupants, compte tenu du caractère encore fragile et inégal de la reprise, ainsi que du fait que la crise continue d'avoir un impact sur les populations vulnérables dans de nombreux pays à faible ou moyen revenu.

Dans ce contexte général, nous discutons les risques de réduction des dépenses sociales pro-pauvres durant la période de reprise. Nous identifions ensuite les mesures d'ajustement considérées par les décideurs politiques (2009-10), qui comprennent (i) la réduction ou la limitation de la masse salariale, (ii) la limitation des subventions, et (iii) un meilleur ciblage de la protection sociale, ainsi que la mise en lumière des risques potentiels pour les enfants et les ménages pauvres.

Tout en reconnaissant l'importance de la stabilité macroéconomique et de l'amélioration des positions fiscales générales afin d'avoir l'espace nécessaire pour atténuer les chocs à venir, ce rapport soulève la question de savoir si la trajectoire d'ajustement budgétaire annoncée pour un certain nombre de pays (en termes de calendrier, d'ampleur et de rapidité d'exécution) est propice pour protéger adéquatement les ménages vulnérables et atteindre les objectifs de développement tels que les OMD. Des options de financement pour la protection des dépenses sociales pro-pauvres sont envisagées. L'article se termine en encourageant les gouvernements et les organisations de développement pour évaluer les coûts de la contraction budgétaire en terme de développement humain, et d'envisager des politiques alternatives qui répondent aux besoins sociaux, pour garantir une reprise économique au bénéfice de tous, qui soit à la fois durable au niveau fiscal et efficace en termes de développement humain et d'équité vis-à-vis des pauvres.

Resumen Ejecutivo

Este trabajo examina las tendencias del gasto público en el corto plazo, y sus posibles repercusiones en niños y hogares pobres en este período de recuperación económica. El informe comienza por analizar si procesos de contracción fiscal y de ajuste del gasto público están ocurriendo en 2010-11 en países en desarrollo. Utilizando datos contenidos en las proyecciones fiscales del Fondo Monetario Internacional en 126 países de bajo y medio ingreso, el análisis muestra que casi la mitad de los países (alrededor del 44%) planean reducir el gasto público durante el período de 2010-11, en comparación con 2008-09. Esto se corrobora en términos del PIB (la reducción media es del 2,7% del PIB), y en términos del valor real de los gastos totales del gobierno, alrededor de 25% de los países incluidos en la muestra se esperan reducciones de un promedio de 6,9%. La magnitud y la rapidez de la contracción del gasto público también resultan preocupantes, dado que la recuperación económica sigue siendo aun frágil, y la población en muchos países en desarrollo sigue sintiendo los impactos negativos de la crisis.

En este clima general de contracción del gasto público, se discuten los riesgos de que también se reduzcan los gastos sociales en un momento en que son muy necesarios. El informe presenta las medidas de ajuste más frecuentemente consideradas en 2009-10: (i) el recorte o freno a los salarios del sector público, (ii) la reducción de subsidios y (iii) una mayor focalización y racionalización de los programas de la seguridad social. El artículo destaca los riesgos potenciales de estas medidas de ajuste en niños y familias pobres.

Si bien se reconoce la importancia de la estabilidad macroeconómica y la mejora de la situación fiscal para mitigar futuras crisis, el informe cuestiona si la trayectoria proyectada de ajuste fiscal en algunos países, en términos de su magnitud y de la velocidad de implementación, es adecuada para proteger a los hogares vulnerables y a alcanzar objetivos nacionales de desarrollo tales como son los ODMs. El documento discute opciones para financiar el gasto social. El artículo cierra alentando a gobiernos y organizaciones de desarrollo a evaluar los costos humanos de la contracción fiscal, y a considerar políticas alternativas que respondan a necesidades sociales, para asegurar una “Recuperación para Todos,” que es fiscalmente sostenible y a la vez eficaz en términos de desarrollo humano con equidad.

1. Introduction

The latest economic indicators reaffirm a picture of growth recovering worldwide, albeit underlined by continued high uncertainty (IMF 2010a and UN 2010a-b). At the same time, the policy focus at the global level seems to have shifted from crisis responses to post-crisis adjustments, with discussions now focused on undertaking fiscal consolidation to restore economic sustainability rather than using fiscal stimulus to avoid deep recession (IMF 2010b-c and G20 2010).

The repercussions of this shift are most palpable and hotly debated in advanced economies. For example, a recent study suggests that in today's environment, fiscal consolidation is likely to have more negative short term effects on growth and employment than usual (IMF 2010d and UN 2010c). To what extent has this line of policy thinking also taken hold in developing countries, where incipient recovery is arguably more fragile and uneven?

This paper (1) examines the extent to which expenditure consolidation is already or likely occurring in 2010-11 among 126 low and middle income countries by compiling and analyzing projected fiscal trends, (2) assesses the risk of pro-poor social spending being adversely impacted in an environment of contracting overall expenditures by examining disaggregated fiscal projection data, where available, and measures commonly considered for achieving such contraction, (3) identifies potential financing options for greater pro-poor spending and (4) raises questions for developing countries to consider regarding the timing, composition and scope of expenditure adjustments in the near term.

Our review is based on information published by the International Monetary Fund (IMF). The fiscal trend analysis is based on country-level fiscal indicators from the latest Regional Economic Outlook (REO) publications (IMF 2010e-i) or, if government fiscal indicators are not provided in the REO publications, fiscal tables contained in recent country reports (issued from July 2009 to July 2010). The identification of possible adjustment measures considered by governments is inferred from policy discussions contained in IMF country reports, which cover Article IV consultations, reviews conducted under lending arrangements (e.g. Stand-by Arrangements and Extended Credit Facility) and consultations under non-lending arrangements (e.g. Staff Monitored Programmes). Combined, these sources provide recent data for 126 low and middle income countries (see Appendices I and II).

Due to the rapid nature of this study, we did not utilize information available from other public domains, and to the extent that the fiscal projections and discussions contained in the IMF reports differ from those in the budget announcements of national governments, our findings are interpretive.¹ In addition, as our findings are based on a snapshot of the projections and policy discussions available at the time of writing, they may need to be re-evaluated in light of

¹ While IMF country reports are published with national governments' consent, differences may arise from alternative projection assumptions and methods, as well as from different treatment of one-off items or special/contingency accounts. See Appendix I for complete details.

new estimates and policy measures. In oil producing countries, for example, fiscal projections are highly sensitive to oil price movements and forecasts. As such, we strongly recommend that they be followed up with in-depth analysis at the country level to arrive at a more robust picture in order to inform dialogues on policies conducive to a “Recovery for All.”²

2. Background: Uneven and Fragile Recovery

For most low and middle income countries, the incipient revival in economic activity appears to be fragile and uneven, as many remain vulnerable to volatile commodity prices, shortfalls in external finance and investments, and, in some instances, financial system weaknesses. More importantly, according to the United Nations Global Pulse (UN 2010d) and the World Bank (2009a and 2010a), the social impacts of the global crisis continue to be felt in terms of rising hunger, unemployment and social unrest. On top of the millions already pushed into poverty in 2008-09, an additional 64 million could fall into extreme poverty during 2010 as a result of the combined, lingering effects of the crisis (World Bank 2010b).

At the household level, the crisis is often felt in terms of employment. Our analysis of the latest labour statistics shows a distressing increase in unemployment—both in terms of the overall rate and number of persons—in the first quarter of 2010 compared to the same quarter a year earlier in many developing countries (Figure 1).³ In South Africa, for example, where the unemployment rate reached 21.2 percent for men and 26.2 percent for women in the first quarter of 2009, another 378,000 men and women were unemployed a year later. In Colombia, an additional 556,000 people became unemployed in the first quarter of 2010 from a year earlier, while, in Mexico, this amounted to 510,000. Jobless rates in Estonia, Latvia and Lithuania jumped by 9.0, 8.5 and 6.4 percentage points, respectively, over the same time period. Such data imply that the recovery of earning prospects at the household level, particularly for those with vulnerable employment, lags behind what aggregate indicators of economic activity would suggest for many developing countries. In this context, the United Nations (UN 2010c-e) has called for continued macroeconomic stimulus, with a greater focus on boosting employment growth, which remains crucial for solidifying and broadening the recovery.

Moreover, as households are coping by compromising essential expenditures, children’s rights to education, health and protection are under increasing threat, particularly for those in the bottom quintiles. For example, a recent study (UNICEF and World Bank 2010) shows that the poorer in Turkey were more likely to experience income losses during the recent economic slowdown and suffer greater welfare losses, reflecting their limited coping capacity.

² See UNICEF (2010a) for detailed discussions on the rationale, objectives and a framework of actions to assist national governments in undertaking policies conducive to an inclusive social and economic recovery.

³ National unemployment estimates may differ from international sources, and the exact magnitude of recent developments should be ascertained within countries.

Figure 1. Percentage Point Change in Unemployment Rate, 2009Q1-2010Q1

Source: Authors' calculations using ILO's labour statistics database (July 2010). See Appendix I for technical notes.

These realities pose a challenge for solidifying and broadening recovery and for countries to meet the Millennium Development Goals (MDGs), especially those related to full and productive employment, education and health. Moreover, given that aggregate economic recovery is unlikely to be soon or strong enough, premature tightening or cutbacks in social spending raises the risk of underfunding public support essential for those hardest hit as well as not generating sufficiently broad-based domestic demand to ensure employment-oriented growth. Thus, while improving fiscal positions is important to provide space to mitigate future shocks, an accommodative public expenditure environment, with maintained—if not increased—levels of pro-poor spending on essential social services and social protection programmes, such as the “Social Protection Floor” (ILO and WHO 2009), is central to a Recovery for All and achievement of the MDGs.

The Outcome Document of the 2010 MDG Summit, agreed by all United Nations member countries, clearly expresses these concerns (UN 2010f). “We, Heads of State and Government... are deeply concerned about the impact of the financial and economic crisis, the worst since the Great Depression. It has reversed development gains in many developing countries and threatens to seriously undermine the achievement of the Millennium Development Goals by 2015.../... accelerating progress will require strengthening national ownership and leadership of development strategies; adopting forward-looking, macroeconomic policies that promote sustained, inclusive and equitable economic growth and increase productive employment opportunities...; adopting policies and measures oriented towards benefiting the poor and addressing social and economic inequalities;... promoting universal access to public and social services and providing social protection floors.”

3. Expenditure Trends in 2010-11

It would have taken longer for incipient recovery to start if governments had not responded with accommodative monetary and fiscal policies in 2008-09 to cushion the blow of the crisis. In a remarkable departure from the past, stronger fundamentals as a result of past economic stabilization efforts and built-up buffers have enabled many developing countries to soften the impact of the global crisis on their economies and populations by expanding public spending during 2008-09 (IMF 2010e). Positive expenditure trends are found for the majority of countries across all regions (Tables 1 and 2). For example, about two-thirds of countries in Sub-Saharan Africa and East Asia and the Pacific increased total government spending by an average of 4.3 and 7.9 percent of GDP, respectively, when comparing 2008-09 average spending levels to those in 2007. Globally, 70 percent of developing countries increased public expenditures by an average of 4.1 percent of GDP (median value of 2.7 percent). In terms of real government spending, 85 percent of developing countries experienced positive growth—an average of 16.7 percent (median value of 12.6 percent)—when comparing 2008-09 average levels to those in 2007.

Source: Authors' calculations based on IMF REO publications (April-May 2010) and IMF country reports (July 2009-July 2010).

Until recently, however, the picture for 2010-11 for a large group of developing countries was more difficult to see due to the general lack of timely, consistent, cross-country data in the public domain. Using fiscal indicators published by the IMF between July 2009 and July 2010, we examined fiscal trends in 126 low and middle income countries in terms of changes in total government expenditures both as percent of GDP and in real terms (see Appendixes I and IV).

3.1. Many Governments Planning or Expected to Contract Total Expenditure in 2010-11

Compared to the 2008-09 experience, we find that a greater number of countries is expected to reduce total government expenditure in terms of GDP in 2010-11 (Table 3). Overall, as many as 56 out of 126 developing countries (or 44 percent) are forecasted to contract total government expenditure by an average of 2.7 percent of GDP in 2010-11 (median value of 1.8 percent).⁴ This shift is most acute in the Middle East and North Africa, with more than 80 percent of countries expected to contract expenditure by an average of 2.4 percent of GDP. East Asia and the Pacific, on the other hand, emerges as the region with the largest expected spending cuts, with an average decrease of 5.9 percent of GDP in 2010-11 when compared to 2008-09.

Table 3. Changes in Total Government Spending by Region, 2010-11 avg. versus 2008-09 avg.
(in percent of GDP, unless noted otherwise)

Region	Countries in Sample			Countries that Raised Spending			Countries that Lowered Spending

Source: Authors' calculations based on IMF REO publications (April-May 2010) and IMF country reports (July 2009-July 2010).

Several countries are projected to experience significant expenditure contraction (Figure 2). In particular, large cuts (5-16 percent of GDP) are expected in eight countries, including Angola, Antigua and Barbuda, Belarus, Maldives, Marshall Islands, São Tomé and Príncipe, Timor-Leste and Yemen. The magnitude of negative spending changes may reflect one or more of the following factors: (i) initial fiscal imbalance made worse by the impact of the global slowdown (e.g. Maldives); (ii) large drop in oil revenues that led to sharp adjustments in public spending (e.g. Angola); (iii) reversal of the measures put in place to mitigate the impact of the 2007-08 food and fuel price increases (e.g. Senegal); (iv) limited capacity to expand spending through

⁴ For 13 countries in Latin America and the Caribbean, up-to-date expenditure data on central or general governments are not available from either country reports or the REOs. Instead, we used the REO fiscal indicators for the public sector, which includes public enterprises that are typically beyond the considerations of fiscal policy (see Appendix I).

Figure 2. Projected Change in Total Government Spending

(in percent of GDP, 2010-11 average over 2008-09 average, unless noted otherwise)

Sources: Authors' calculations based on the IMF's REO publications (April-May 2010) and country reports (July 2009-July 2010). See Appendixes I and III for details.

Note: Value for Timor-Leste reflects % of non-oil GDP.

borrowing due to perceived high debt and country risk (e.g. Jamaica); and (v) donors' advice on fiscal policy, which is reflected to varying degrees in the projected fiscal trends.

Our overall finding of public spending contraction among many developing countries is consistent with another recent study that uses at least some non-publicly available data sources. Kyrili and Martin (2010) examine national budget documents for 56 low income countries and find that while two-thirds of the sample increased their budget deficits to counter the effects of the global crisis in 2009, only one-quarter have continued related recovery programmes in 2010. They further show that on average budget deficits are expected to halve in 2010, with the fastest cuts occurring in those low income countries that are most in need of protecting vulnerable populations.

When measuring fiscal trends in terms of the changes in the real value of total expenditures (in other words, nominal expenditure adjusted by consumer price index), however, fewer countries are expected or likely to contract total government expenditures in 2010-11 (31 out of 126 governments or about a quarter) (Table 4). The average size of the projected expenditure contraction in real terms is 6.9 percent (median value is 6.5 percent). Of these, more than half may experience over five percent decline in real expenditure, with Angola, Antigua and Barbuda, Grenada, Jamaica, Madagascar, and São Tomé and Príncipe expected to reduce real total government expenditure by over 12 percent (Figure 3).⁵ As this picture reflects the combined effects of the reduced total government expenditure and the erosion in their real value caused by increases in local prices, several countries that are expected to experience substantial inflation in 2010-11 stand out (e.g. Angola, Belarus, Eritrea, Iran, Jamaica, and São Tomé and Príncipe).

 (2010-11 average over 2008-09 average, unless noted otherwise)

3.2. Drivers of Projected Expenditure Changes by Region

Developing countries' ability to apply fiscal stimulus or sustain expenditure patterns depends on a number of factors, such as revenue generation capacity, initial debt burden, access to capital markets and/or macroeconomic fundamentals. Using cross-country data on fiscal projections, we also examined the main drivers behind projected changes in total government expenditures in GDP percentage terms in order to understand regional and individual country trends.

In Sub-Saharan Africa, about half of the developing countries are expected to contract total expenditure as a percentage of GDP under current policy directions (Figure 4.1). This appears to be mainly driven by a substantial decline in expected revenue in 2010-11 compared to 2008-09, as well as the apparent inability to secure new financing (i.e. selling government assets and/or new debt borrowing) to offset revenue shortfalls, reflecting the region's relatively high initial debt burden and limited access to capital markets. In Swaziland, for example, new financing is expected to increase although the amount is insufficient to offset the large drop in revenue, resulting in an expenditure reduction of about -3.6 percent of GDP. With the exceptions of Comoros, the Democratic Republic of Congo, and São Tomé and Príncipe, grants do not appear to be a major factor behind projected expenditure trends.

Latin America's low and middle income countries have fared relatively well and show signs of quick recovery in 2010-11 with a majority of countries (19 out of 27) expected to further expand expenditure from 2008-09 levels in terms of GDP (Figure 4.2). This largely reflects stronger financing efforts as well as growing revenues in several countries (e.g. El Salvador, Guyana, Haiti, Nicaragua, St. Lucia and Venezuela). On the other hand, many Caribbean countries, some of which were under considerable debt distress prior to the global economic slowdown, are expected to undertake substantial expenditure cuts, including Antigua and Barbuda, Dominica, Grenada and Jamaica. Brazil and Mexico, two of the region's largest economies, are also forecasted to experience a small contraction in public expenditures, while Argentina, the other major economy, will expand government spending largely through net debt financing.

As a region, the Middle East and North Africa appears to be one of the hardest hit in terms of government revenue (Figure 4.3). Nearly all of its developing countries are forecasted to experience a revenue decline, with Algeria, Egypt, Iraq, Morocco and Yemen expected to experience contractions of three or more percent of GDP in 2010-11 compared to 2008-09.⁶ Lower revenues, coupled with limited scope for increased net debt financing to sustain expenditure patterns during the previous time period, drive the region to scale back total government expenditure (10 out of 12 countries). On the aggregate, this amounts to about -1.7 percent of GDP, with Jordan and Yemen undergoing the steepest declines at -4.4 and -5.9 percent of GDP, respectively.

⁶ As revenues in many countries in this region are largely connected to oil prices, this finding is particularly sensitive to changes in oil price projections.

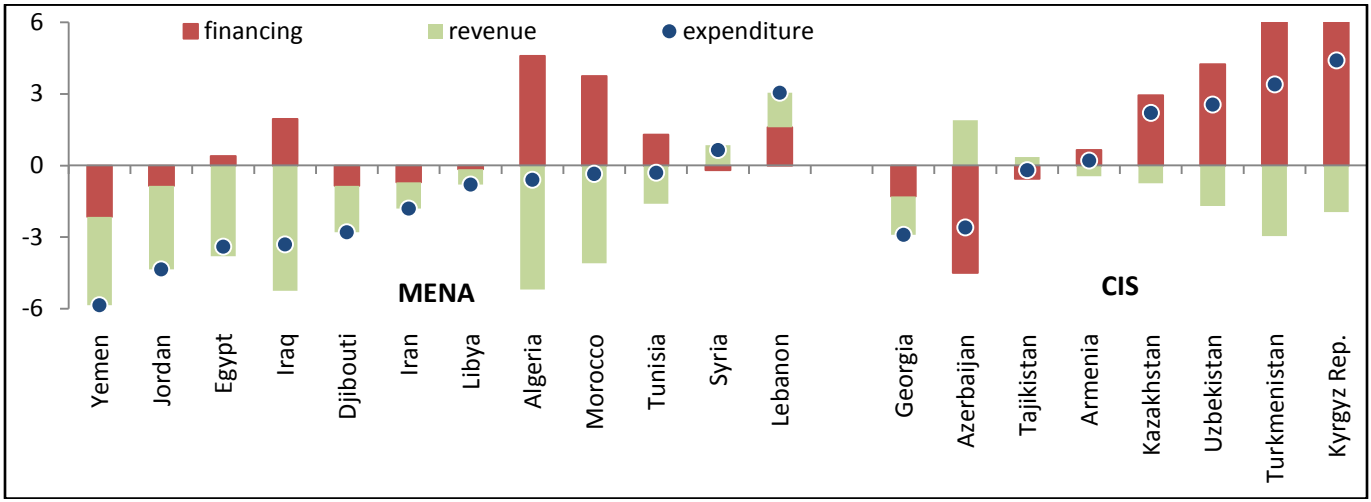

Figure 4.4. Central and Eastern Europe

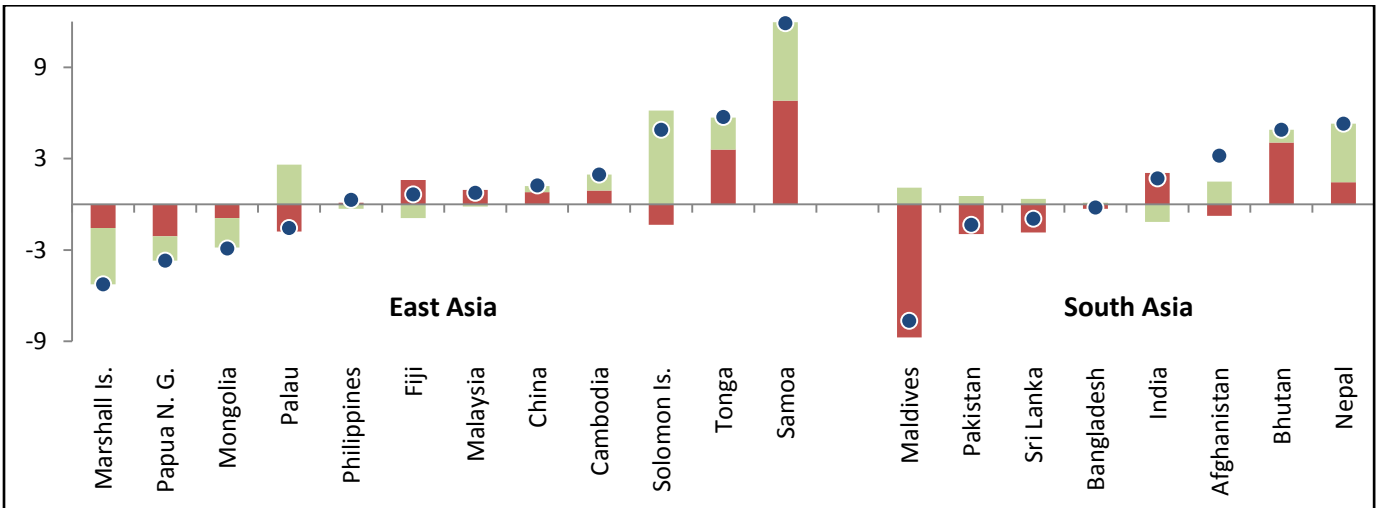

Figure 4.5. East Asia and South Asia

Sources: Authors' calculations based on IMF projections. See Appendix I for complete details.

In the Commonwealth of Independent States (CIS) and Central and Eastern Europe (CEE), revenue declines are expected to be moderate with relatively heavy reliance on debt financing to support expansive public spending, partly reflecting the low initial debt burden across the regions (Figures 4.3 and 4.4). The most noteworthy cases include Belarus, Montenegro, Russia, Turkmenistan and Uzbekistan, all of which are predicted to endure revenue losses between two and eight percent of GDP along with implied increases in public debt levels by up to six percent of GDP.⁷ Overall, 12 of the 21 low and middle income countries in the CIS and CEE are expected to increase government expenditures in 2010-11 compared to 2008-09, with a regional average increase of 0.3 percent of GDP.

Low and middle income countries in East and South Asia are divided in terms of overall projected expenditures, with roughly half of the sample expected to increase public spending as a percentage of GDP in 2010-11 when compared to 2008-09 (Figure 4.5). While there are no dominant trends for the region as a whole, small island developing countries emerge as outliers, with the Maldives and Marshall Islands undergoing large expenditure cuts (7.7 and 5.3 percent of GDP, respectively) and Samoa, the Solomon Islands and Tonga experiencing significant increases (11.9, 4.9 and 5.8 percent of GDP, respectively). Both of the world's most populous countries—China and India—are forecasted to expand public spending by 1.3 and 1.7 percent of GDP, respectively, mainly through debt financing. Conversely, Bangladesh and Pakistan, which are also among the world's most populous nations, are expected to slightly decrease government expenditures in GDP terms.⁸ On the aggregate, developing countries in East Asia are estimated to decrease public spending by 0.1 percent of GDP over the time period with South Asia undergoing a 0.6 percent increase.

4. Will Social Spending be Preserved in a Contracting Environment?

A contracting expenditure environment is historically associated with greater risks of social spending being adversely impacted. Past evidence suggests that when governments resorted to aggregate fiscal cuts, social spending was typically unprotected. Research on the crisis of the 1980s (UNICEF 1987) shows that a significant share of developing countries experienced disproportionately large cuts in social spending areas (e.g. health, education or social security) when compared to aggregate expenditure (Table 5). Even more importantly, vulnerable populations were found to have suffered the largest cutbacks, both within social and other spending categories, like economic services and defense. Hicks (1991) finds that, during the period 1970-84, when a sample of 24 developing reduced expenditures, social sectors on average experienced smaller cuts than the total expenditure, but still received the third highest cuts; defense budgets, on the other hand, were found to be the most protected.

⁷ This does not necessarily imply debt distress. For example, the debt level of Uzbekistan is low and does not present any danger to debt sustainability.

⁸ Pakistan's position may be affected by the current devastating flooding across the country.

Note: 'vulnerable' = percentage decline more than aggregate expenditure; 'protected' = percentage decline less than aggregate expenditure; 'highly protected' = percentage increase during cuts in aggregate expenditure.

* Includes expenditure on agriculture and forestry, fishing, mining, manufacturing, construction, utilities and transport.

Among country-level studies, Ravallion (2002) finds that aggregate budget cuts in Argentina during the 1980s and 1990s typically resulted in proportionately greater cuts in social spending, and spending on targeted social assistance and employment programmes was more vulnerable to aggregate spending cuts than that on more universal social services. Research by Paxson and Schady (2005) on Peru also shows that public spending on health contracted sharply during the crisis in the late 1980s, which partly explains the rise in infant mortality. These findings highlight the need for action to support pro-poor spending at times of aggregate fiscal contraction.

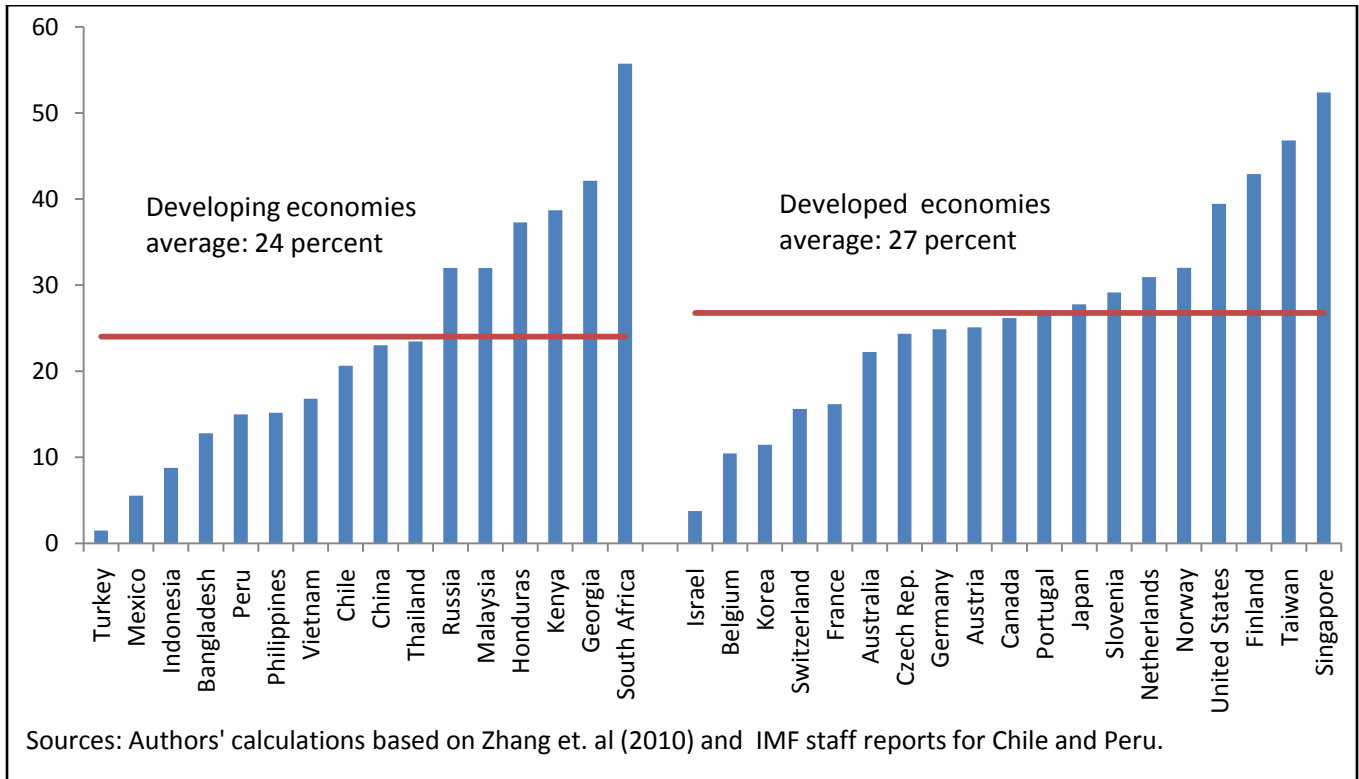

The recent crisis of food/fuel price increases and global economic slowdown, while differing in nature and magnitude from previous crises, has been shown to have caused significant revenue shortfalls among many developing country governments along with economic difficulties at the household level. In this context, what has been the recent experience in social spending essential to child wellbeing?

4.1. The 2008-09 Experience

This time around, the vital need for preserving social spending appears generally better recognized. Emerging evidence from the limited data available suggests that a considerable number of developing countries protected or increased social spending and other priority spending during 2008-09, despite falling revenues. For example, on average about 24 percent of the total announced fiscal stimulus amounts by developing countries was directed at pro-poor and social protection programmes (Figure 5). Yang and others (2010) show that 16 of 19 low income country programmes initiated in 2008-09 and supported by IMF lending facilities had budgeted higher social spending in 2009. In Sub-Saharan African countries with IMF-supported programmes, recently available spending outturn data show that the median value of social spending increased by 0.5 percent of GDP from 2008-09, and real spending growth accelerated from 4.8 to 6.8 percent (IMF 2010f).

Despite the general efforts to safeguard social expenditures in many developing countries, there is evidence that growth in social spending has slowed during 2008-09. A recent analysis (Brumby and Verhoeven 2010) shows that, on average, social spending (education and health) growth fell to below two percent during 2009 after averaging nearly ten percent between 2005 and 2008.

Figure 5. Size of Social Protection Component of Stimulus Packages
(in percent of total announced amount)

4.2. Risks for Social Spending in 2010-11

General increases in social spending during 2008-09 were largely facilitated by an overall expansionary fiscal stance and reflected a greater policy emphasis on protecting vulnerable populations from the negative shocks of the crisis. However, now that more governments are planning or expected to contract overall expenditure in the near term, will social spending suffer major cuts as in the past?

Limited preliminary evidence reveals a mixed bag. On the one hand, recent studies suggest a bleak outlook for social expenditures in some developing countries. For example, Kyrili and Martin (2010) find that two-thirds of 56 low income countries surveyed are cutting budget allocations in 2010 to one or more “priority” pro-poor sectors, which include education, health, agriculture and social protection. They further show that while expenditures on infrastructure, health and agriculture rose in 2009, they are expected to fall in 2010, with social protection allocations contracting in 2009-10 and ending the period more than 0.2 percent of GDP lower than in 2008, on average. Willem et al. (2009) also find significant reductions in social spending in the 2009-10 budgets among several countries in their sample of ten developing countries.

On the other hand, policy discussions described in recent IMF country reports suggest a greater emphasis on safeguarding “priority” social spending than in the past, most notably in low income countries supported under the IMF’s new lending framework. The IMF’s latest REO for Sub-Saharan Africa (2010e) shows that the median projected value of the budget for health and education spending is to increase slightly as a percent of GDP in 2010, although there is considerable intra-region variation with oil exporters and fragile states expected to undergo declines in 2010. To cite one example, social and priority spending in the Republic of Congo is projected to rise by two percent in real terms over 2010-11 while other spending is projected to decline (IMF 2010j).

Given the limited availability of data on social spending and the uncertain outlook in a fiscally contracting environment, our assessment is that even in countries with a policy intention of safeguarding “priority” pro-poor social spending (Box 1), there is a heightened risk of social spending and service delivery falling below the levels needed to adequately support vulnerable populations. In particular, one of the most immediate effects of the crisis in developing countries is heightened uncertainty in budget planning and implementation, which compounds existing weaknesses in social spending and service delivery. For example, in an environment where recovery in fiscal revenue is slow and the demand for government assistance remains great, inadequacies in social spending and service delivery are quickly exacerbated.

Box 1. Problems of Data and Definitions for Pro-poor Social Spending

There are different approaches to budgeting. For instance, public expenditures are often presented using a **functional classification**, which is the amount allocated to different sector ministries (education, health, social security/welfare, agriculture, transport, energy, defense, etc.). In general, social spending includes education, health, social security and labour, and, in some instances, housing and water. However, updated and accurate information on sector expenditures is not easily available in many countries.

IMF reports, on the other hand, contain timely information on public expenditures using an **economic classification**, which is based on aggregates across ministries (e.g. wage bill, transfers, goods and services, and investments). According to this classification, the wage bill (payroll of civil servants) is usually the largest component of public expenditures in low income countries and, accordingly, is one of the first items to be considered for cuts during adjustment periods. These classifications do not take into account distributional impacts.

National plans and policy discussions often identify the need to protect **“priority” pro-poor social expenditures**. Pro-poor indicates some consideration of distributional impacts. However, there is no universally accepted definition of pro-poor social expenditures, and the definition changes from country to country.

In practice, primary education and health are common elements of “priority” pro-poor social expenditures, but other investments with positive distributional impacts on vulnerable children and poor households may not be included if they are not viewed as priority by the government, such as social protection, water supply and sanitation, or public housing (Box 2). Our reading of recent IMF country reports also suggests that a wide variety of spending categories—such as electricity, judiciary and, in some cases, defense-related—were included in “priority” social spending to be protected under country programmes. These approaches raise the question about the effectiveness of priority setting in safeguarding those areas of social spending that are most essential for directly supporting vulnerable populations.

UNICEF, together with the United Nations, has a multidimensional approach to child wellbeing. The Convention of the Rights of the Child (UN 1990), which was ratified by 192 countries, clearly states the need to invest in eradicating all child deprivations. Children have a right not only to education and health, but also to food, clean drinking water, sanitation, shelter and other necessary investments for their families, including those related to basic livelihoods.

The expansion of social protection coverage, which was observed in a sizable number of developing countries as part of the crisis response, also comes under risk of losing its momentum, as more governments are increasingly targeting benefits (see section 4.3) and shifting priorities to jump-starting growth by making greater allocations to other sectors in their 2010 budgets, such as infrastructure and energy.

The heightened risk of inadequate social spending is further reflected by other factors. A reported or budgeted increase in “priority” spending may not cover certain social spending areas that are essential to vulnerable children and their families (Box 2). Moreover, cash management difficulties and capacity limitations can cause substantial delays in disbursements

Box 2. Expenditure Contraction and Social Spending: The Experience of Ghana

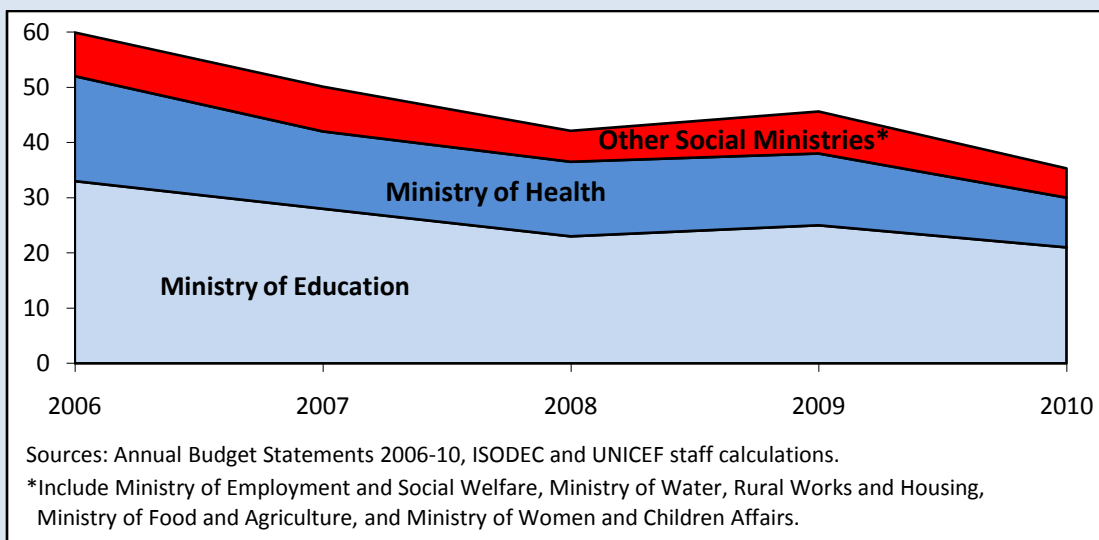

Ghana's economy came under severe distress in 2008 as a result of expansionary fiscal policy and the impact of the global crisis. The government, in response, sought fiscal consolidation and tighter real expenditure in the 2009-10 budgets. At the same time, macroeconomic difficulties coupled with higher local food prices and weakening economic activity threatened to push more Ghanaians into poverty (UNICEF Ghana 2010). Studies by local researchers calculated that monetary poverty among children would be 30 percent higher in 2011, and that hunger among children would rise an additional seven percent (from 58 to 65) in 2011 due to the crisis. The impact may be especially acute in the three northern regions where poverty remained high despite the dramatic reduction in national poverty levels.

The IMF-supported programme provides for a floor for poverty-reducing budget expenditure, which is programmed to increase from 8.7 percent of non-oil GDP in 2008-09 to 8.8 percent in 2010-11, while total expenditure is planned to contract by about three percent. Ghana's public audit accounts show that the poverty-reducing expenditures in 2009 went mostly to the Ministries of Education (69 percent of total poverty-reduction expenditure) and Health (19 percent), followed by the Ministry of Interior (7.3 percent), the Ministry of Food and Agriculture (3.7 percent), and the Ministry of Roads and Highways (1.1 percent).

However, other social ministries with a key role in supporting vulnerable children and their families appear to form a trivial part of this protected spending category. For example, the Ministry of Employment and Social Welfare accounted for less than 0.3 percent of the total poverty reducing expenditure, and the Ministry of Women and Children Affairs, as well as the Ministry of Water, Works and Housing, comprised about 0.1 percent each. Further, when measuring social spending by the share of all relevant social ministry budgets in the total government budget, the social spending allocation appears to be falling (Figure 6).

While positive steps have been taken by the government (e.g. continued expansion of the cash transfer programme and free school uniforms to poor children), greater expenditure allocation to essential social areas are required to ensure that children and their families can survive the adverse impacts, including hunger, despite the overall contraction in public spending.

Figure 6. Ghana: Percent Share of Social Sector Budget in Total Discretionary Budget

and implementation, even when budgeted amounts are preserved or increased. For example, in Pakistan, spending on the Benazir Income Support Programme amounted to only 10.4 billion rupees in the first quarter of 2009-10 compared to the 14 billion rupees projected under the programme (IMF 2010k).

On balance, despite the greater policy emphasis on preserving “priority” expenditures, social spending cuts remain a major concern for many developing countries in a climate of fiscal contraction. This points to the need to improve the efficiency of spending by strengthening governance and the quality of fiscal institutions, which could help increase the level of social services without additional spending in the medium term (Gupta, et al., 2008). In the short term, however, sustained allocations to the social sector and employment-generating economic programmes are needed to support a broad-based recovery.

5. Adjustment Measures and their Potential Risks to the Poor

The adjustment measures that countries choose to achieve expenditure consolidation have direct implications for social spending and the poor. Some measures involve tradeoffs. For example, what impact would wage cuts have on private spending and, hence, on aggregate demand and economic recovery? In addition, the measures commonly considered for achieving expenditure consolidation are prone to certain design and implementation limitations, thus resulting in possible unintended consequences for those vulnerable groups whom priority social spending is intended to protect.

Examining key measures potentially considered by governments, as discussed in IMF country reports, we find that a large number of governments is considering capping or cutting wage bills, phasing out or removing fuel or food subsidies, and rationalizing or reforming transfers such as social protection, whereas the expansion of wages, subsidies and social transfers are being contemplated in a fewer number of countries (Table 6). To the extent that measures eventually adopted by governments may differ from those under consideration, the countries shown in Table 6 are indicative, and actual outcomes require verification.

5.1. Wage Bill Cuts or Caps

As recurrent expenditures like salaries tend to be the largest component of national budgets, a sizable number of countries is looking to cut or cap wage bills as a way to achieve planned fiscal consolidation, often as part of civil service reforms. If well designed and executed, this could generate fiscal savings that could be used for increasing low government wages for essential public service providers and expanding essential posts required to meet the MDGs.¹⁰

However, at least in the short term, there are risks that wage bill cuts or caps may translate into salaries being reduced or eroded in real value, payments in arrears, hiring freezes or employment retrenchment, which can adversely impact the delivery of basic social services, particularly in high poverty areas (Box 3). UNICEF (2010b) analysis of recent salary information for primary teachers and nurses shows that their pay in real terms was significantly diminished by increases in local prices during 2009 in about a third of the countries for which data are available. The data also suggest that, in about half of the countries in the sample, teachers or nurses are not adequately compensated when comparing their pay with at least one income or cost of living benchmark.

⁹ Togo is improving the composition of the transfers by limiting subsidies to certain populations while expanding for others.

¹⁰ UNESCO (2010) points that the rate at which teaching posts are created will need to increase if universal primary education is to be achieved by 2015.

Box 3. Cambodia's Wage Bill Cuts in 2010

In Cambodia, the number of poor people is estimated to have increased by at least 200,000 in absolute terms as a result of the recent crises (World Bank 2009b). Confronted by a growing fiscal deficit, the government announced that it would be reducing the number of contracted and temporary staff in all sector ministries by 50 percent in fiscal year 2010. Part of the logic to reduce Cambodia's wage bill was to create fiscal space for priority social investments. However, after discussions with sector ministries and development partners, an exception was granted to the health and education sectors since it would be impossible to deliver social services without necessary staff. Yet it remains enforced for other ministries, some with long-term implications for equity in service delivery, such as the Ministry of Social Affairs where social worker coverage was already low before reductions were imposed (1 per 25,000 persons). To further contain the expansive wage bill, the government also announced that salary supplementation, allowances and incentive schemes for civil servants would be cancelled and replaced by a new streamlined system. UNICEF, along with other development partners, has pointed to the potential unintended consequences of removing salary incentives on the quality of service delivery. For instance, incentives can double the base salary for certain civil servant categories in Cambodia, such as health sector staff, and shortly after their discontinuation, UNICEF site surveys showed increased staff absenteeism and/or reduced working hours (UNICEF 2010c).

As low pay is a key factor behind teacher absenteeism, informal fees and brain drain, it is essential to protect the positions and compensation of essential public sector employees such as teachers, medical staff and social protection workers. Decisions on wage bills need to ensure that the pay, employment and retention of essential social sector staff are safeguarded at all times to protect child-related social services—and enhanced when fiscal situations improve—in order to support greater human capital development for long-term growth and the achievement of the MDGs.

5.2. Limiting Subsidies

A significant number of countries appears to be considering the reduction or removal of subsidies, often accompanied by the development of more targeted social safety nets as a way to compensate the poor. The logic is to remove market distortions while supporting the poor by targeted transfers. As some argue (Coady et. al. 2010), generalized subsidies are frequently ineffective, costly and inequitable, and should be removed in favor of more targeted and pro-poor measures.

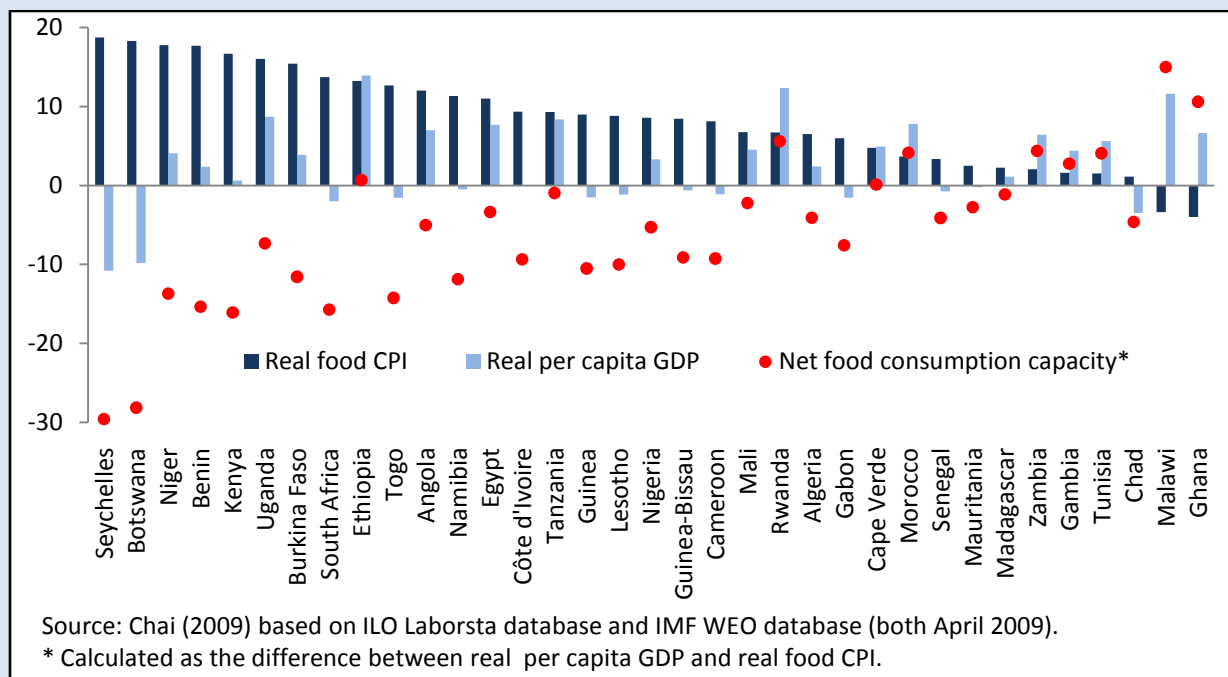

However, some countries have removed subsidies at a time when there is still a high level of need for public food and nutrition support (Box 4). Recent analysis (UNICEF 2010d) warns that domestic food prices remain high in many developing countries; in some, prices have continued to ascend, such as maize prices in Tanzania and rice prices in Vietnam. Until a functioning targeted social safety net is put in place, a case may be made to extend the use of general consumer subsidies, possibly modified to encourage pro-poor self-selection (e.g. providing subsidies on those goods that the poor tend to consume disproportionately more), as at least a

Box 4. Could the Removal of Food Subsidy Come Too Soon for Some Countries?

During the food and fuel crisis, many developing countries increased subsidies or cut taxes on food and/or fuel between 2006 and 2008 (IMF 2008a). However, upon the easing in international commodity prices in late 2008, several African countries, including Seychelles, Niger, Burkina Faso and Senegal, reversed the temporary measures of food subsidies and duty exemptions (IMF 2009), despite the lack of a clear indication that a compensatory safety net measure had successfully been put in place.

UNICEF staff analysis (Chai 2009) shows that many African countries continued to experience substantial local food price increases well after the international food commodity prices tapered off, and the high inflation in local food prices had been prolonged, lasting eight months on average. Consequently, the cumulative increases in local food prices outpaced those in per capita GDP, suggesting that, on average, these countries' populations were less able to afford the same amount of food than before (Figure 7). Further, comparing the recent food crisis with other episodes of high food price inflation in recent history indicates that in about half of the African countries for which data are available, the recent food crisis is the worst in the past decade (e.g. in Seychelles and Burkina Faso).

Figure 7. Africa: Food Prices and Per-Capita GDP, May 2007-May 2009
(percentage change over the recent 24 months)

As the poor tend to be disproportionately affected by food price shocks and associated negative coping methods (e.g. cutting back on education and health expenditures), prolonged high food prices can inflict particularly severe and potentially irreversible damage on poor children and pregnant women. Careful analysis of the local realities facing the poor, prior to the removal of the subsidies, is thus important to avoid jeopardizing the long-term development of human capital. In the short term, while more cost-effective safety net measures are being developed, better designed food subsidies or custom tax exemptions may be warranted, which could be cost effective when combined with nutrition interventions such as micronutrient and weaning supplements. A Poverty and Social Impact Analysis for Senegal, for example, concluded that maintaining the tax suspension for rice in the short term, while simultaneously expanding existing school lunch and primary health care programmes, would benefit the poor (IMF 2008b).

short term measure to protect children and poor households from the rising prices of essential goods and services. Moreover, while subsidies are often withdrawn quickly, a functioning targeting mechanism takes a considerable amount of time to design and implement, and this timing mismatch threatens to leave behind the most vulnerable.

5.3. Further Targeting

Economists often advise governments to better target their spending when cuts are called for, as a way to reconcile poverty reduction with fiscal austerity (Ravallion 1999). Our review confirms that this measure is currently being considered by many countries, particularly in those under tight fiscal pressures (e.g. Maldives) or with the legacy of an extensive social welfare system (e.g. Mongolia).

Targeting could deliver more cost-effective social assistance and yield fiscal savings over the medium term. In the short term, however, the design and implementation of new targeting schemes invariably have limitations that may result in the unintended effects of excluding vulnerable and marginalized children and their families, particularly where poverty is widespread. A key limitation is that means-tested targeting is costly, administratively complex and requires significant civil service capacity (Mkandawire 2005). Targeting reforms can also lead to significant delay and large under-coverage (Box 5 on Moldova).

Another limitation is that, due to a confluence of budgetary and political economy considerations, the scope of the target often falls short of adequately covering vulnerable populations and, instead, tends to focus only on the extreme poor or the poorest (Box 5). This leaves many poor people excluded from receiving any type of cash benefit at a time when their need for public assistance is significant. Thus, a strong case may be made to extend universal transfers (e.g. to families with children) or to carry out geographic targeting to provide immediate support to vulnerable groups facing unexpected and prolonged shocks until adequate administrative capacity is developed to effectively implement more sophisticated systems.

Furthermore, current practices of targeting by income or consumption poverty do not adequately take into account other dimensions of poverty, such as lack of ready access to schools and clean water or health facilities. As a result, those children whose families meet the minimum consumption criteria but remain vulnerable to dropping out of school, malnutrition and/or child mortality due to the deprivations of a safe and enabling environment are at risk of being left behind. Several studies (Alkire and Seth 2008, and Coulombe and Chai 2010) indicate that this exclusion risk could be empirically significant. This consideration calls for setting targeting criteria beyond consumption or income poverty measures.

In summary, typical adjustment measures, such as cutting/capping wages, phasing out subsidies and further targeting social protection schemes, have risks to the poor and should not be applied without an assessment of their social impacts and alternative policy options.

Box 5. Targeting Social Assistance: The Case of Moldova

In 2008, Moldova reformed its social assistance system, moving gradually from a system of category-based nominal compensations for individuals (disabled children and adults, lone pensioners, war veterans, multi-children families, etc.) to poverty-targeted cash benefits for households. Under the previous system, the benefits were small, and less than half of the poorest Moldovans were covered. The new social assistance system is designed to target the poorest households while also increasing the benefit provided.

However, extensive delays occurred in implementing the new system, which were compounded by complicated application procedures and confusion among qualified households. As a result, less than half of the eligible beneficiaries had applied for support one year after the launch. Moreover, households that enrolled in the new system were required to re-apply after a period to continue receiving benefits; one-third of eligible households failed to do so. The government has since taken several actions to strengthen the system.

Moldova's experience underscores the risks of targeting-based reforms. Above all, means-testing is complex to implement and often leads to delays and/or under-coverage. In this example, barely 40 percent of targeted beneficiaries was receiving support 18 months after the launch of the new system, and this was only expected to increase to two-thirds after more than two years had passed (Figure 8). The protracted start-up time also meant that most vulnerable families had to cope with the economic crisis with little or no assistance.

Figure 8. Beneficiaries under the New Social Assistance System in Moldova
(in thousands of persons)

Another major risk of targeting-based reform is not to include, by design, the majority of vulnerable populations. While the scope of the targeted population is often a difficult policy decision for governments, in Moldova the safety net is being targeted to the bottom poorest, compared to 26.4 percent of the population that is below the poverty line. This means that many poor people are excluded from any type of cash benefit despite their continued need for public assistance.

Sources: Barca, et. al (2010); Malhotra, et. al (2009); and Olteanu, et. al (2009).

From a broader perspective, macroeconomic and expenditure decisions are often taken without an adequate analysis of their potential impacts in terms of employment, social development and inclusive and resilient growth. In particular, some analyses question the logic of using micro-interventions to support the poorest, while adopting macroeconomic policies which may tend to benefit the non-poor (UN 2010e and UNRISD 2010). The logic of these studies is based on looking at the wider distributional impacts of economic decision-making, and they are supported by calls by the United Nations Secretary-General and the ILO that macroeconomic policies should not only focus on debt stabilization and curbing inflation, but should ultimately support growth of real output, employment and social development (UN 2010g and ILO 2009).

Just as stress tests are widely accepted to gauge financial sector vulnerabilities, they could likewise be used to assess the potential social consequences of macroeconomic policies, as well as social protection system capacity to address them (Kanbur 2010). There are precedents in distributional analysis, poverty and social impact analysis (PSIAs), and studies and evaluations of equitable policies, which expanded from the late 1990s (Ortiz 2008). In addition, more and better data and analysis are needed, in terms of collecting real-time accurate information, as recognized by the United Nations Global Pulse (UN 2010d), as well as in terms of assessing alternative scenarios to simulate impacts on social and labour market indicators both with and without policy responses (Islam and Chowdhury 2010). If properly designed and carried out, such analysis could alert policymakers on the potential distributional impacts of different options.

6. Exploring Financing Options for Greater Pro-Poor Social Spending

In most of the examples seen in this paper, a common factor behind expenditure consolidation is some combination of lower revenues and limited scope for increasing debt financing to sustain expenditure patterns. To what extent is it possible to maintain social expenditures, and how can this be accomplished in the context of economic recovery?

For some low income countries where the government's and households' buffer is low and capacity for domestic resource generation is limited, maintaining adequate social expenditure will be difficult without concessional external support. For these countries, large scale, concessional external financing from the donor community will remain crucial for lessening human sufferings and preventing setbacks in achieving the MDGs (UN 2010b).

For other low and middle income countries, the most viable option is to focus on generating domestic resources by expanding the tax base, reducing waste and inefficiencies from government operations, improving public financial management and introducing progressive taxes, if feasible (Box 6). This may be combined with reprioritization of public expenditures for essential social investment by reducing low-impact, ineffective spending. Governments may also consider drawing down reserves when this does not pose major external risks. Where countries' debt levels are sustainable and there is capacity for sound debt management,

domestic or external borrowing may be an alternative. These options, consistent with policy positions of the international financial institutions (IMF 2010), should be fully explored prior to making decisions on expenditure cuts that could have potentially detrimental impacts on children and hinder a Recovery for All.

Box 6. Potential Financing Options for Expanded Pro-poor Spending

- Acquiring concessional external financing without jeopardizing macroeconomic stability, such as through grants, concessional borrowing or debt relief (e.g. G7 countries announced in February 2010 that they would cancel their bilateral debt with Haiti to aid the country in reconstruction efforts).
- Increasing domestic revenues, such as by broadening the tax base, increasing progressive taxation (e.g. income tax, taxing the financial sector or taxes on natural resources, cars, cigarettes) and/or eliminating revenue leakages (e.g. strengthening tax administration, closing tax loopholes and rationalizing tax exemptions/incentives). Some recent examples include a tax to help fund conditional cash transfers in Brazil, the Mongolia Development Fund from copper exports, Bolivia's use of hydrocarbon royalties for its National Development Plan, and consideration of bank taxes in the U.S. and the U.K.
- Eliminating, where immediately possible, inefficiencies at different levels that could lead to cost-savings in public programmes (e.g. more effective channeling of resources to the end-beneficiaries while minimizing leakages). However, care should be taken as sector reforms are only feasible in the medium term and will not generate sufficient fiscal space in the short term.
- Re-prioritizing public expenditures for essential social investment by reducing low-impact, ineffective spending (e.g. Costa Rica abolished its military in 1948 and channeled additional resources into social services).
- Tapping government reserves, especially among developing countries that achieved a significant expansion over the past decade (e.g. Brazil's reserves grew from US\$50 to US\$250 billion from 2005-10, and the government was able to lend dollars to businesses during the height of the global credit crunch and extend social assistance to aid a faster recovery).
- Commercial borrowing where debt levels are sustainable and there is capacity for sound debt management (e.g. Tanzania, which has a low debt distress level, borrowed US\$1.5 billion from local and foreign commercial banks to boost its 2010-11 budget and cover a deficit left by an unexpected withdrawal of donor support).
- A more accommodating macroeconomic policy framework for both social and economic recovery, which is not exclusively focused on controlling inflation and fiscal deficits, but also on real output, incomes and employment (e.g. Indonesia has allowed a higher deficit in order to bolster recovery efforts).

Through maintained or expanded pro-poor social spending, these financing options support countries' progress towards the MDGs, and when properly managed, can be consistent with the objective of macroeconomic stability. In the immediate term, in particular, an accommodative macroeconomic policy framework which is not exclusively focused on controlling inflation and

fiscal deficits, but also on real output, incomes and employment, may be feasible without jeopardizing the policy framework that earned countries low inflation. The appropriate timing and scope of expenditure adjustment for a given developing country will depend on its specific macroeconomic and social circumstances, such as debt distress level, degree of openness, quality of fiscal institutions, and the magnitude of the external and domestic shock impact on poor and vulnerable families, taking into account their initial coping capacity.

7. Concluding Remarks

Based on information published by the IMF, our review finds that a significant number of low and middle income countries is tightening or planning to tighten public expenditures in 2010-11. Common adjustment measures considered by policymakers during the period 2009-10 include wage bill cuts or caps, limiting subsidies (e.g. on food) and further targeting social protection. Fiscal consolidation is now being pursued in a greater number of countries when the recovery is still fragile and uneven, and vulnerable populations continue to suffer from the cumulative effects of the food/fuel price increases and the global economic slowdown.

Protecting the poor and the vulnerable is crucial to equitably sharing the adjustment costs of macroeconomic crises. However, macroeconomic and expenditure decisions are often taken without significantly assessing their potential impacts in terms of employment, social development, and inclusive and resilient growth. Current policies focusing on fiscal consolidation may have major impacts on social spending and other expenditures that foster aggregate demand, and therefore recovery. The distributional impacts, as well as possible alternative policy options for social and economic recovery, should be reviewed by key decision makers.

Many of those likely to be hardest hit are poor, marginalized children and their families. The limited window of intervention for fetal development and growth among young children means that their deprivations today, if not addressed promptly, will have largely irreversible impacts on their physical and intellectual capacities, which will in turn lower their productivity in adulthood—this is a high price for a country to pay. Providing immediate and adequate support for children and their families is therefore an urgent imperative. This requires a careful assessment of the risks facing vulnerable and poor populations and balancing policies to restore medium-term macroeconomic sustainability with those to protect and support the socially and economically vulnerable in the immediate term, both which are necessary to achieve a country's sustained growth and human development potential.

The greater emphasis now placed by many countries on safeguarding social spending is a major and welcome step towards achieving that balance. As public financial management further improves in developing countries, there will likely be greater success in achieving the dual objectives of restoring macroeconomic stability and protecting the vulnerable. To mitigate the risk of social spending being adversely impacted during expenditure contraction in the short

term, it is important to focus policies on preserving and expanding social spending within a framework of medium-term fiscal sustainability.

Some potential questions for policymakers to consider in this regard may include:

- Is attention given to basing expenditure policy decisions on both economic and social indicators that are sufficiently disaggregated to capture the conditions of the poor? Are recovery policies considering high unemployment, rising food prices and social inequalities?
- What are the social impacts of macroeconomic policy decisions, including the opportunity cost of not scaling up equity-based interventions and social protection programmes, both which are essential for a “Recovery for All”? Are ‘stress tests’ to assess the capacity of social protection systems to withstand shocks being undertaken? Are effective support policies being designed and implemented, with attention to whether policy responses can occur quickly and effectively?
- Is the fiscal adjustment trajectory—in terms of scope and pace—conducive to the achievement of the MDGs? Are alternative scenarios fully explored in debt and fiscal sustainability assessment exercises that could help accommodate a socially responsive recovery?
- Given the limitations and exclusion risks of common targeting practices, are alternative approaches—such as a basic level of social protection and services (the United Nation’s proposed social protection floor)—fully considered in order to better achieve the objectives of protecting the vulnerable, increasing their resilience, and maximizing their human development potential and economic participation?

In the words of the United Nations Secretary-General (2010): *“As the G20 considers ‘fiscal consolidation and exit strategies from extraordinary macroeconomic and financial support measures,’ I urge all governments to take into account—besides the usual macroeconomic indicators—human development objectives and impacts, especially through job recovery... We must act now. We must avoid reverting to the pre-crisis conditions that denied too many of our fellow human beings a fair chance at a decent living... We must work together to establish the basis for a more secure, prosperous and equitable world for all.”*

Appendix I: Data Description

Overview

All quantitative data presented by the authors in this paper are based on country-level fiscal indicators from the latest IMF Regional Economic Outlook (REO) publications (IMF 2010e-i) or, if government fiscal indicators are not provided in the REO publications, fiscal tables contained in recent IMF country reports (approval dates from July 2009 to July 2010). The sample is limited to those countries classified as low or middle income according to the World Bank (as of July 2010).¹¹ Within these parameters, there is data for 126 countries, which are characterized as follows: (i) 36 are low income, 48 are lower middle income and 42 are upper middle income; (ii) 85 reflect data from REO publications and 41 from country reports;¹² and (iii) 113 have expenditure data in terms of the central, federal, national, or general government, while 13 are in terms of the public sector. The data description table below provides the complete background on the expenditure data used for all countries in the sample.

Caveats

The scope of government expenditure data varies across countries. In most instances, the data refer to central and local government, and for some countries, the data refer to the public sector, which include public enterprises.

Revenue, expenditure and overall balance data from IMF sources may differ from those reported in national budgets due to alternative projection assumptions and methods. In the case of Algeria, for example, revenue differences are attributed to alternative estimates for international oil prices, and expenditure differences reflect the IMF's lower capital expenditure estimates based on past spending trends, as well as the IMF's non-inclusion of special/contingency accounts.

As more economic and fiscal indicators become available, subsequent expenditure projections may differ from the projections used in this study, which are based on IMF REO publications (IMF 2010e-i) and country reports (approval dates from July 2009 to July 2010).

Technical Notes

Figure 1: All countries reflect labour force survey data except for Belarus, Bosnia and Herzegovina, Mauritius, Mongolia, Romania, Serbia and Ukraine whereby employment office records were used. The reporting period for unemployment data is monthly for all countries with the following exceptions: the quarterly average applies to Argentina, Bolivia, Ecuador, Egypt, Estonia, Israel, Jordan, Kazakhstan, Lithuania, Mexico and South Africa; and the three month moving average applies to Colombia and Peru.

Figure 4: In Figure 4.1, Burundi, Lesotho and Liberia were excluded due to very large ODA movements; increase in revenue in São Tomé and Príncipe is almost entirely due to receipt of oil signature bonuses; In Figure 4.5, Timor-Leste was excluded due to very large financing and revenue movements.

¹¹ Available at: <http://data.worldbank.org/about/country-classifications/country-and-lending-groups>.

¹² Data from country reports were utilized for four Latin American countries included in the REO publication in order to obtain central government values rather than public sector values (Costa Rica, Dominican Republic, Guatemala and Paraguay).

Appendix II: IMF Country Reports Reviewed

Overall, 93 countries were analyzed to develop Table 6: Selected Adjustment Measures Commonly Considered, 2009-10. The identification of possible adjustment measures considered by governments is inferred from policy discussions contained in IMF country reports, which cover Article IV consultations, reviews conducted under lending arrangements (e.g. Stand-by Arrangements and Extended Credit Facility) and consultations under non-lending arrangements (e.g. Staff Monitored Programmes). All country reports included in the sample were approved between July 2009 and July 2010. The complete list, along with approval date and specific report type, is provided below.

#	Country	Date	Report Type
1	Albania	23-Apr-10	Staff Report for the 2010 Article IV Consultation
2	Algeria	16-Dec-09	2009 Article IV Consultation
3	Angola	26-Apr-10	First Review under the Stand-By Arrangement and Request for a Modification of a Performance Criterion
4	Armenia	11-Jun-10	Request for Three-Year Arrangements under the Extended Fund Facility and Extended Credit Facility, and Cancellation of the Stand-By Arrangement
5	Azerbaijan	19-Apr-10	2009 Article IV Consultation
6	Bangladesh	23-Dec-09	2009 Article IV Consultation
7	Belarus	15-Mar-10	Fourth Review Under the Stand-By Arrangement
8	Benin	27-May-10	2010 Article IV Consultation and Request for a Three-Year Arrangement Under the Extended Credit Facility—Staff Report; Staff Supplements and Staff Statement; Public Information Notice and Press Release on the Executive Board Discussion; and Statement by the Executive Director
9	Bhutan	7-Dec-09	2009 Article IV Consultation
